

EASy CONSOLE

EAS Monitoring and Editing Software

- Alerts Station Operators of Incoming EAS Messages
- Modify Appearance and Content of EAS Messages Before Distribution
- Intuitive Interface for Rapid Message Editing and Distribution

The EASy Console™ message management software offers broadcast operators a fast, efficient means of customizing incoming EAS (Emergency Alert System) messages before redistribution to viewers.

EAS Traffic Alerting

Installed on a PC within the broadcast station and configured to monitor as many as eight EASyCAST™ Encoder/Decoders, EASy Console software provides a convenient way to alert operators of incoming EAS messages.

EASy Console runs as a background program in Windows®, and is transparent to the operator until a monitored EASyCAST Encoder/Decoder alerts the EASy Console program of an incoming alert. The EASy Console software visually and audibly alerts the operator of an incoming alert.

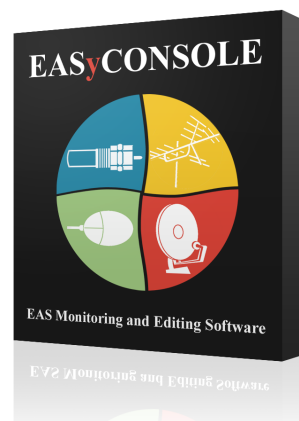

Message Appearance and Content

The EASy Console software gives operators unrivaled flexibility in editing and customizing EAS messaging. When distributing EAS messaging to a Visionary™ or Visionaries, operators have control over all on-screen properties:

- Font, type size, and color of the crawl text
- Location of the crawl text on the screen
- Additional static text can be added, with control over font, type size, color, and location on the screen
- Station logos, bugs, and photographs can be placed

Fast Response and Redistribution

Once an alert has been received by EASy Console, the operator has the ability to edit, send, or abort the alert message. With time being critical in EAS message distribution, the EASy Console software is specifically designed to allow convenient, fast editing of EAS messages. Upon notification of an incoming message, the operator can immediately retransmit the message. Should any modifications to the EAS message be necessary – such as the inclusion of a station logo

or a photograph to accompany an Amber Alert – EASy Console's intuitive interface allows for quick message turn-around and retransmission.

System Flexibility

EASy Console can receive EAS messaging from as many as eight EASyCAST Encoder/Decoders. EASy Console can control up to eight Visionaries for each EASyCAST Encoder/Decoder: EAS messaging can be distributed on as many as 64 Visionaries.
